

DigiEye 680 Series

Digital Radiography System

Improved for your better experience

DigiEye 680 Series

Digital Radiography System

DigiEye 680 series are ceiling-mounted digital radiography systems with a compact footprint. The system offers a range of benefits to users. Its mechanical structure and workflow programming are uniquely designed to improve operational efficiency, and the use of Mindray's self-made components helps to save costs. These advantages contribute to the system's ability to deliver a fast, smooth, and valuable examination and diagnostic experience.

Suitable for All Examinations Types

Mobile Imaging Solution 360° Dedicated Patient Care

By utilizing a mobile detector within an ergonomic design, the system enables more patient-oriented applications.

Proven Image Quality Precise Diagnosis

The application of the unique 'Level' post-processing software optimizes and enhances image details to support clinical diagnosis. The intuitive and multilingual user interface, along with the post-processing flow, allows end-users to obtain high-quality images efficiently, without the need for retakes and associated time waste.

Advanced Panoramic Imaging Function -- iStitch

The iStitch function enhances the application of panoramic digital radiographic images, including whole spine or long bone images. With just a button click, the system automatically completes the entire imaging process without requiring any additional manual operations.

M-Share

Shares a single detector among multiple Mindray DR machines to enable ultra-fast data transmission and quick imaging times

Remote Connectivity

- MiCo+ is a medical imaging IT solution that connects multiple imaging modalities and medical institutions.
- It provides a series of dedicated applications on variable platform for different clinical scenarios, such as telemedicine, online education, imaging quality control and so on.
- Through the connections among equipment, medical professionals, and institutions, it opens the door for professional and transboundary communities of creating better medical imaging service.
